Your first job in IT — in the shortest time possible!

Step-by-step guide for beginners

"How to find my first job in IT?"
This is the question many beginners ask. Entering IT sounds attractive, but not everyone knows where to start.
That's why we created a short guide that will help you get a job in IT and start your career successfully.

What skills you need to enter IT

A good programmer needs to have these 4 types of skills:

- **Hard skills**
- **Soft skills**
- **Good English**
- **Career skills**

or your ability to find a good job in a short time.
Here, we will stop and explain it in detail

What do you need to find a job in IT

So, to find your first job in IT, you need:

- **CV**
- **LinkedIn profile**
- **Portfolio**

1 CV

This is your professional passport. It's better to keep it short, decent, and comprehensive. Your CV will show an employer how well you will be able to do the tasks for a new job.

What do you need to point out?

- Your work experience and achievements on previous jobs. For every company you worked for, it's better you indicate 3-5 main tasks and 3-5 main achievements. Measurable and clear achievements will make you stand out from the crowd!
- Your skills, knowledge, and tools. If you have a certificate that proves that you master some tool – add it too.
- Your education. Don't miss the courses you took – employers will look at additional education too.

2 LinkedIn profile

There are 58 million companies on LinkedIn. And many of them are searching for IT specialists right now. That's why you definitely should have a strong LinkedIn profile. It's better to get in touch with your ex. coworkers there – they can introduce you to your future employer.

3 Portfolio

The more projects you have in your portfolio, the more chances are that you will find a job and the higher your salary will be. But what if you are a beginner with an empty portfolio?
You have two options. You can network and talk to your acquaintances: find out who needs help with projects. This way you will gain experience and fill your portfolio. Or you can join an IT course for beginners and do some projects there.

For example, there are three courses in Coding Invaders that will let you master one out of 7 professions. After each of them, you will be a job-ready professional with a portfolio on GitHub with at least 10 projects in it.
Choose yours and get into IT successfully!

Join it

These points are enough to appear well prepared for your first interview.
